## PATENT COOPERATION TREATY

From the INTERNATIONAL SEARCHING AUTHORITY

To: RICHARD D. CONARD  
BARNES & THORNBURG  
11 SOUTH MERIDIAN STREET  
INDIANAPOLIS IN 46204

**PCT**

NOTIFICATION OF TRANSMITTAL OF  
THE INTERNATIONAL SEARCH REPORT  
OR THE DECLARATION

(PCT Rule 44.1)

Date of Mailing (day/month/year) <b>28 AUG 2000</b>	
Applicant's or agent's file reference 20568-64399	FOR FURTHER ACTION See paragraphs 1 and 4 below
International application No. PCT/US00/00105	International filing date (day/month/year) 04 JANUARY 2000
Applicant CHROMATIS NETWORKS INC.	

1. ☒ The applicant is hereby notified that the international search report has been established and is transmitted herewith.

**Filing of amendments and statement under Article 19:**

The applicant is entitled, if he so wishes, to amend the claims of the international application (see Rule 46):

**When?** The time limit for filing such amendments is normally 2 months from the date of transmittal of the international search report; however, for more details, see the notes on the accompanying sheet.

**Where?** Directly to the International Bureau of WIPO  
34, chemin des Colombettes  
1211 Geneva 20, Switzerland  
Facsimile No.: (41-22) 740.14.35

For more detailed instructions, see the notes on the accompanying sheet.

2. ☐ The applicant is hereby notified that no international search report will be established and that the declaration under Article 17(2)(a) to that effect is transmitted herewith.

3. ☐ With regard to the protest against payment of (an) additional fee(s) under Rule 40.2, the applicant is notified that:

☐ the protest together with the decision thereon has been transmitted to the International Bureau together with the applicant's request to forward the texts of both the protest and the decision thereon to the designated Offices.

☐ no decision has been made yet on the protest; the applicant will be notified as soon as a decision is made.

4. **Further action(s):** The applicant is reminded of the following:

Shortly after 18 months from the priority date, the international application will be published by the International Bureau. If the applicant wishes to avoid or postpone publication, a notice of withdrawal of the international application, or of the priority claim, must reach the International Bureau as provided in rules 90 bis 1 and 90 bis 3, respectively, before the completion of the technical preparations for international publication.

Within 19 months from the priority date, a demand for international preliminary examination must be filed if the applicant wishes to postpone the entry into the national phase until 30 months from the priority date (in some Offices even later).

Within 20 months from the priority date, the applicant must perform the prescribed acts for entry into the national phase before all designated Offices which have not been elected in the demand or in a later election within 19 months from the priority date or could not be elected because they are not bound by Chapter II.

### INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference 20568-64399	<b>FOR FURTHER ACTION</b> see Notification of Transmittal of International Search Report (Form PCT/ISA/220) as well as, where applicable, item 5 below.		
International application No. PCT/US00/00105	<table style="width: 100%; border: none;"> <tr> <td style="width: 60%; border: none;">           International filing date (day/month/year)            04 JANUARY 2000         </td> <td style="width: 40%; border: none;">           (Earliest) Priority Date (day/month/year)            07 JUNE 1999         </td> </tr> </table>	International filing date (day/month/year) 04 JANUARY 2000	(Earliest) Priority Date (day/month/year) 07 JUNE 1999
International filing date (day/month/year) 04 JANUARY 2000	(Earliest) Priority Date (day/month/year) 07 JUNE 1999		
Applicant CHROMATIS NETWORKS INC.			

This international search report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This international search report consists of a total of 2 sheets.

☒ It is also accompanied by a copy of each prior art document cited in this report.

**1. Basis of the report**

- a. With regard to the language, the international search was carried out on the basis of the international application in the language in which it was filed, unless otherwise indicated under this item.
- ☐ the international search was carried out on the basis of a translation of the international application furnished to this Authority (Rule 23.1(b)).

- b. With regard to any nucleotide and/or amino acid sequence disclosed in the international application, the international search was carried out on the basis of the sequence listing:

- ☐ contained in the international application in written form.
- ☐ filed together with the international application in computer readable form.
- ☐ furnished subsequently to this Authority in written form.
- ☐ furnished subsequently to this Authority in computer readable form.
- ☐ the statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.
- ☐ the statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished.

2. ☐ Certain claims were found unsearchable (See Box I).

3. ☐ Unity of invention is lacking (See Box II).

4. With regard to the title,

- ☒ the text is approved as submitted by the applicant.
- ☐ the text has been established by this Authority to read as follows:

5. With regard to the abstract,

- ☒ the text is approved as submitted by the applicant.
- ☐ the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box III. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority.

6. The figure of the drawings to be published with the abstract is Figure No. 13

- ☒ as suggested by the applicant.
- ☐ because the applicant failed to suggest a figure.
- ☐ because this figure better characterizes the invention.
- ☐ None of the figures.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/US00/00105

**A. CLASSIFICATION OF SUBJECT MATTER**

IPC(7) : H04B 10/00, 10/04, 10/06, 10/12, 10/28

US CL : 359/118, 119, 152, 154, 164

According to International Patent Classification (IPC) or to both national classification and IPC

**B. FIELDS SEARCHED**

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 359/118, 119, 152, 154, 164

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

IEEE DATABASE

search term: ring network, node, transceiver

**C. DOCUMENTS CONSIDERED TO BE RELEVANT**

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	US 5,647,035 A (CADEDDU et al) 08 JULY 1997, FIGURES 1-6	1-27
Y	US 4,482,980 A (KOROWITZ et al) 13 NOVEMBER 1984, FIGURES 1, 2, AND 4	1-27
Y	US 5,406,401 A (KREMER) 11 APRIL 1995, FIGURES 1 AND 2	1-27
Y	US 4,704,713 A (HALLER et al) 03 NOVEMBER 1987, FIGURES 2A, 3	1-27
Y	US 4,837,856 A (GLISTA, JR) 06 JUNE 1989, FIGURES 2, 5	1-27

Further documents are listed in the continuation of Box C.

See patent family annex.

\* Special categories of cited documents:

\*A\* document defining the general state of the art which is not considered to be of particular relevance

\*E\* earlier document published on or after the international filing date

\*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

\*O\* document referring to an oral disclosure, use, exhibition or other means

\*P\* document published prior to the international filing date but later than the priority date claimed

\*T\*

later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

\*X\*

document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

\*Y\*

document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

- ☐ . . . . .
- ☐ . . . . .

**Precautionary Designation Statement:** In addition to the designations made above, the applicant also makes under Rule 4.9(b) all other designations which would be permitted under the PCT except any designation(s) indicated in the Supplemental Box as being excluded from the scope of this statement. The applicant declares that those additional designations are subject to confirmation and that any designation which is not confirmed before the expiration of 15 months from the priority date is to be regarded as withdrawn by the applicant at the expiration of that time limit. (Confirmation (including fees) must reach the receiving Office within the 15-month time limit.)

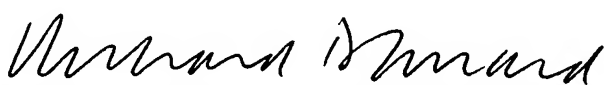

<b>Box No. VI PRIORITY CLAIM</b>		<input type="checkbox"/> Further priority claims are indicated in the Supplemental Box.		
Filing date of earlier application (day/month/year)	Number of earlier application	Where earlier application is:		
		national application: country	regional application:* regional Office	international application: receiving Office
item (1) <b>(07.06.99)</b> <b>07 June 1999</b>	<b>60/137,983</b>	<b>US</b>		
item (2)				
item (3)				

☒ The receiving Office is requested to prepare and transmit to the International Bureau a certified copy of the earlier application(s) (only if the earlier application was filed with the Office which for the purposes of the present international application is the receiving Office) identified above as item(s): **(1)**

\* Where the earlier application is an ARIPO application, it is mandatory to indicate in the Supplemental Box at least one country party to the Paris Convention for the Protection of Industrial Property for which that earlier application was filed (Rule 4.10(b)(ii)). See Supplemental Box.

<b>Box No. VII INTERNATIONAL SEARCHING AUTHORITY</b>			
Choice of International Searching Authority (ISA) (if two or more International Searching Authorities are competent to carry out the international search, indicate the Authority chosen; the two-letter code may be used):		Request to use results of earlier search; reference to that search (if an earlier search has been carried out by or requested from the International Searching Authority):	
<b>ISA/ US</b>		Date (day/month/year)	Number Country (or regional Office)

<b>Box No. VIII CHECK LIST: LANGUAGE OF FILING</b>	
This international application contains the following number of sheets: request : <b>3</b> description (excluding sequence listing part) : <b>10</b> claims : <b>4</b> abstract : <b>1</b> drawings : <b>6</b> sequence listing part of description : <b>0</b> Total number of sheets : <b>24</b>	This international application is accompanied by the item(s) marked below: 1. <input checked="" type="checkbox"/> fee calculation sheet 2. <input type="checkbox"/> separate signed power of attorney 3. <input checked="" type="checkbox"/> copy of general power of attorney; reference number, if any: <b>(2)</b> 4. <input type="checkbox"/> statement explaining lack of signature 5. <input type="checkbox"/> priority document(s) identified in Box No. VI as item(s): 6. <input type="checkbox"/> translation of international application into (language): 7. <input type="checkbox"/> separate indications concerning deposited microorganism or other biological material 8. <input type="checkbox"/> nucleotide and/or amino acid sequence listing in computer readable form 9. <input checked="" type="checkbox"/> other (specify): <b>Transmittal Letter to the US/RO Return Postal Card</b>
Figure of the drawings which should accompany the abstract: <b>13</b>	Language of filing of the international application: <b>English</b>

<b>Box No. IX SIGNATURE OF APPLICANT OR AGENT</b>	
<small>Next to each signature, indicate the name of the person signing and the capacity in which the person signs (if such capacity is not obvious from reading the request).</small>	
 <b>Richard D. Conard, Agent for Applicants</b>	

<b>For receiving Office use only</b>	
1. Date of actual receipt of the purported international application: 3. Corrected date of actual receipt due to later but timely received papers or drawings completing the purported international application: 4. Date of timely receipt of the required corrections under PCT Article 11(2): 5. International Searching Authority (if two or more are competent): <b>ISA/</b>	2. Drawings: <input type="checkbox"/> received: <input type="checkbox"/> not received: 6. <input type="checkbox"/> Transmittal of search copy delayed until search fee is paid.

BARNES &amp; THORNBURG

NOTIFICATION OF TRANSMITTAL OF  
INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT

(PCT Rule 71.1)

To: RICHARD D. CONARD BARNES & THORNBURG 11 SOUTH MERIDIAN STREET INDIANAPOLIS, IN 46204
--

Date of Mailing  
(day/month/year)

02 AUG 2001

Applicant's or agent's file reference 20568-64399		IMPORTANT NOTIFICATION
International application No. PCT/US00/00105	International filing date (day/month/year) 04 January 2000 (04.01.2000)	Priority date (day/month/year) 07 June 1999 (07.06.1999)
Applicant CHROMATIS NETWORKS, INC.		

1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.
4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices)(Article 39(1))(see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

**I. Basis of the report****1. With regard to the elements of the international application:\***

- ☒ the international application as originally filed.
- ☒ the description:  
pages 1-10 as originally filed  
pages NONE; filed with the demand  
pages NONE, filed with the letter of \_\_\_\_\_.
- ☒ the claims:  
pages 11-14, as originally filed  
pages NONE, as amended (together with any statement) under Article 19  
pages NONE, filed with the demand  
pages NONE, filed with the letter of \_\_\_\_\_.
- ☒ the drawings:  
pages 1-6, as originally filed  
pages NONE, filed with the demand  
pages NONE, filed with the letter of \_\_\_\_\_.
- ☐ the sequence listing part of the description:  
pages NONE, as originally filed  
pages NONE, filed with the demand  
pages NONE, filed with the letter of \_\_\_\_\_.

**2. With regard to the language, all the elements marked above were available or furnished to this Authority in the language in which the international application was filed, unless otherwise indicated under this item.**

These elements were available or furnished to this Authority in the following language \_\_\_\_\_ which is:

- ☐ the language of a translation furnished for the purposes of international search (under Rule 23.1(b)).
- ☐ the language of publication of the international application (under Rule 48.3(b)).
- ☐ the language of the translation furnished for the purposes of international preliminary examination (under Rules 55.2 and/or 55.3).

**3. With regard to any nucleotide and/or amino acid sequence disclosed in the international application, the international preliminary examination was carried out on the basis of the sequence listing:**

- ☐ contained in the international application in printed form.
- ☐ filed together with the international application in computer readable form.
- ☐ furnished subsequently to this Authority in written form.
- ☐ furnished subsequently to this Authority in computer readable form.
- ☐ The statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.
- ☐ The statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished.

**4. ☒ The amendments have resulted in the cancellation of:**

- ☒ the description, pages NONE
- ☒ the claims, Nos. NONE
- ☒ the drawings, sheets/fig NONE

**5. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed, as indicated in the Supplemental Box (Rule 70.2(c)).\*\***

\* Replacement sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to this report since they do not contain amendments (Rules 70.16 and 70.17).

\*\* Any replacement sheet containing such amendments must be referred to under item 1 and annexed to this report.

**V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement****1. STATEMENT**

Novelty (N)	Claims <u>1-27</u>	YES
	Claims <u>NONE</u>	NO
Inventive Step (IS)	Claims <u>NONE</u>	YES
	Claims <u>1-27</u>	NO
Industrial Applicability (IA)	Claims <u>1-27</u>	YES
	Claims <u>NONE</u>	NO

**2. CITATIONS AND EXPLANATIONS (Rule 70.7)**

Please See Continuation Sheet

**VIII. Certain observations on the international application**

The following observations on the clarity of the claims, description, and drawings or on the questions whether the claims are fully supported by the description, are made:

The drawings are objected to under PCT Rule 66.2(a)(v) as lacking clarity under PCT Article 7 because: the applicant claims a plurality of receivers and transmitters but fails to show them in the drawings (e.g. "fifth receiver" "sixth receiver").

The description is objected to under PCT Rule 66.2(a)(v) as lacking clarity under PCT Article 5 because it fails to contain an adequate written description of the plurality of receivers claimed throughout the application. The description is inadequate because: although the applicant claims a "third" through "sixth" receiver in the node, the applicant fails to disclose these receivers in the specification.

Claims 2 and 7-12 are objected to as lacking clarity under PCT Rule 66.2(a)(v) because practice of the claimed invention is not adequately described in writing, as required under PCT Rule 5.1(a)(iii), for the reasons set forth in the immediately preceding paragraph.

Claims 2 and 7-12 are objected to under PCT Rule 66.2(a)(v) as lacking clarity under PCT Article 6 because claims 2 and 7-12 are indefinite for the following reason(s): it is not clear to the examiner whether there are more than two receivers in certain nodes or whether the applicant has used a way of labeling certain receivers according to which node they are in.

**V. 2. Citations and Explanations:**

Claims 1-12 and 22-27 lack an inventive step under PCT Article 33(3) as being obvious over Korowitz (U.S. Patent Number 4,482,980).

Regarding Claim 1, Korowitz teaches first and second optical fibers for carrying information modulated on an optical carrier (reference numerals 28, 30 in Figure 1), at least two nodes at a first one of which information modulated on the carrier is to be recovered and transmitted (column 4 lines 46-51), the first node including apparatus for receiving and transmitting the information (reference numeral 24, 25 in Figure 1), the apparatus for receiving and transmitting the information including a first receiver (reference numeral 32 in Figure 2) for recovering the information from the optical carrier carried on the first optical fiber, a second receiver (the optical detector in OEI 25 in Figure 2) for recovering information modulated on the optical carrier carried on the second optical fiber, a transmitter for modulating data information on the second optical fiber (the optical transmitter in OEI 25 in Figure 2) and a first splitter for splitting a signal carried on the first optical fiber, the first splitter coupled to the first optical fiber and the first receiver (reference numeral 36 in Figure 2). Korowitz differs from the claimed invention in that Korowitz fails to specifically teach a first optical splitter for splitting the optical carrier on the first optical fiber. One skilled in the art would clearly have recognized that although Korowitz teaches an electrical splitter and selector (reference numeral 36 in Figure 2) for splitting a converted optical signal to one of three electrical lines, one could have easily chosen to employ an all optical approach in order to reduce the possibility of signal loss due to conversion from an optical signal to an electrical signal. One skilled in the art would have been further motivated to use an all optical approach in order to increase reliability, being that the electrical splitter and selector taught by Korowitz is susceptible to mechanical failure. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to use a splitter capable of splitting the optical carrier carried on the first optical fiber (an optical splitter) as opposed to an electrical splitter and selector taught by Korowitz in order to avoid signal loss and to increase reliability.

Claims 2, 8, 10, and 12 recite limitations similar to those of claim 1. Therefore, claims 2, 8, 10, and 12 lack an inventive step for the same reasons as those stated regarding claim 1 above. Furthermore, mere duplication of parts for a multiplied effect is not the type of innovation for which a patent monopoly is to be granted.

Regarding Claims 3-6 and 22-27 Korowitz teaches a means for recovering an optical carrier from and returning an optical carrier to the first and second optical fiber (see Figure 2).

Regarding Claims 7, 9, and 11, although Korowitz fails to teach a third or fourth receiver as claimed, mere duplication of parts for a multiplied effect is not the type of innovation for which a patent monopoly is to be granted.

Claims 13-21 lack an inventive step under PCT Article 33(3) as being obvious over Korowitz (U.S. Patent Number 4,482,980) in

**Supplemental Box**

(To be used when the space in any of the preceding boxes is not sufficient)

view of Haller (U.S. Patent Number 4,704,713).

Regarding Claims 13, 14, 16, 17, 19, and 21, Korowitz differs from the claim invention in that Korowitz fails to teach that the first and second receiver are coupled to a selection function which selects between the optical carrier from the first optical fiber and the optical carrier from the second optical fiber. However, Korowitz does suggest a recovery feature that allows one node to circumvent problem nodes in the event of a fault in the system (column 9 lines 4-42). One skilled in the art would clearly have recognized that in order to prevent loss of information in an optical communication system, one could have used a working and a protection fiber and further would have recognized the benefits of having the ability to switch between the two fibers in the event of a fault in the system. Haller, in the same filed of endeavor, teaches that it is well known in the art to employ a selection function that selects which of two receivers will receive a signal from one of two optical carriers from one of two optical fibers (reference numeral 241 in Figure 2b) in the event of a fault in the system. One skilled in the art would clearly have appreciated the ability to use the teachings of Haller in the device of Korowitz in order to achieve a selection means between two fibers. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to employ a selection function which selects between the optical carrier from the first or second optical fiber, as taught by Haller, and apply those teachings to the device of Korowitz in order to prevent the loss of information in the event of a fault in the system.

Claims 15, 18, and 20 recite limitations similar to those of claims 13, 14, 16, 17, 19, and 21. Therefore, claims 15, 18, and 20 lack an inventive step for the same reasons as those stated regarding claims 13, 14, 16, 17, 19, and 21 above.

(54) Title: **DUAL HOMING FOR DWDM NETWORKS IN FIBER RINGS**

(57) Abstract: First and second optical fibers (26 eastbound, 26 westbound) carry information modulated on an optical carrier ( $\lambda_1, \lambda_2, \dots, \lambda_N$ ). Information modulated on the carrier ( $\lambda_1, \lambda_2, \dots, \lambda_N$ ) is to be recovered and transmitted at a first node (30) along the first and second optical fibers (26). The first node (30) includes apparatus for receiving and transmitting the information. The apparatus for receiving and transmitting the information includes a first receiver (either 80- $\lambda_1$ -1, 80- $\lambda_2$ -1, ... 80- $\lambda_N$ -1 or 80- $\lambda_1$ -2, 80- $\lambda_2$ -2, ... 80- $\lambda_N$ -2) for demodulating the information modulated on the optical carrier ( $\lambda_1, \lambda_2, \dots, \lambda_N$ ) and carried on the first optical fiber (either 26 eastbound or 26 westbound), a second receiver (either 80- $\lambda_1$ -1, 80- $\lambda_2$ -1, ... 80- $\lambda_N$ -1 or 80- $\lambda_1$ -2, 80- $\lambda_2$ -2, ... 80- $\lambda_N$ -2) for demodulating the information modulated on the optical carrier ( $\lambda_1, \lambda_2, \dots, \lambda_N$ ) and carried on the second optical fiber (either 26 eastbound or 26 westbound), a transmitter (78- $\lambda_1$ ,

78- $\lambda_2$ , ... 78- $\lambda_N$ ) for modulating the information on the second optical fiber (either 26 eastbound or 26 westbound), and a splitter (40) for splitting the optical carrier ( $\lambda_1, \lambda_2, \dots, \lambda_N$ ) carried on the first optical fiber (either 26 eastbound or 26 westbound). The splitter (40) is coupled to the first optical fiber (either 26 eastbound or 26 westbound) and the first receiver (either 80- $\lambda_1$ -1, 80- $\lambda_2$ -1, ... 80- $\lambda_N$ -1 or 80- $\lambda_1$ -2, 80- $\lambda_2$ -2, ... 80- $\lambda_N$ -2). A portion of the optical carrier ( $\lambda_1, \lambda_2, \dots, \lambda_N$ ) is coupled to the first receiver (either 80- $\lambda_1$ -1, 80- $\lambda_2$ -1, ... 80- $\lambda_N$ -1 or 80- $\lambda_1$ -2, 80- $\lambda_2$ -2, ... 80- $\lambda_N$ -2) and another portion of the optical carrier ( $\lambda_1, \lambda_2, \dots, \lambda_N$ ) continues on the first optical fiber (either 26 eastbound or 26 westbound).

WO 00/76092 A1

## DUAL HOMING FOR DWDM NETWORKS IN FIBER RINGS

Field of the Invention

This invention relates to networks. It is disclosed in the environment  
5 of dense wavelength division multiplexed (DWDM) networks, but is believed to be  
useful in other applications as well.

Background of the Invention

Referring to Fig. 1, DWDM networks 20 implemented over fiber rings  
10 22 can carry diverse types of traffic such as, for example, SONET, ATM, IP, and so  
on. These networks 20 are capable of mixing different types of traffic in the same  
ring 22. A typical DWDM network 20 includes an arbitrary number of nodes 24  
interconnected in a ring topology by a pair of optical fibers 26. One of the nodes 24 is  
designated the hub node 30. The other nodes 24 are referred to as terminal nodes 32.  
15 Each terminal node 32 uses one or more dedicated DWDM wavelengths  $\lambda_J, \lambda_K, \dots$   
 $\lambda_P, 1 \leq J, K, \dots P \leq N$ , to communicate with the hub node 30. The hub node 30 has  
the capability to switch traffic from one wavelength  $\lambda_1, \lambda_2, \dots \lambda_N$  to another. This  
permits communication between any pair of terminal nodes 32 on the network 20.  
The DWDM channel  $\lambda_1, \lambda_2, \dots \lambda_N$  used to transmit traffic from the hub node 30 to a  
20 specific terminal node 32 over one of the fibers 26 is called a downlink. The DWDM  
channel  $\lambda_1, \lambda_2, \dots \lambda_N$  of the same wavelength operating on the other fiber 26 used to  
transmit traffic from the terminal node 32 to the hub node 30 is called an uplink. The  
resulting network 20 is sometimes described as a virtual DWDM star network  
implemented over a fiber ring 22. The protocol used in the interaction between the  
25 hub node 30 and a specific terminal node 32 is arbitrary and independent of the  
protocol used by any other terminal node 32. Examples of protocols include the  
above-mentioned SONET/SDH, ATM and IP. Where different channels  $\lambda_1, \lambda_2, \dots$   
 $\lambda_N$  use different protocols, all channels  $\lambda_1, \lambda_2, \dots \lambda_N$  may be assumed to be using a  
common protocol, for example, SONET/SDH framing, with the other protocols, for  
30 example, ATM, IP and so on, mapped into the assumed common protocol  
(SONET/SDH frames in this example). Both the hub node 30 and the terminal nodes  
32 have the capability to effect the appropriate protocol processing on both incoming

-2-

and outgoing traffic. All nodes 24, including the hub 30, have local tributary interfaces which permit the connection of external equipment to the network 20.

A network 20 as describe above is expected to be extremely reliable and remain fully or at least partially operational despite faults of different types. Of special, although not exclusive, interest in the context of this application are the following types of faults: the failure of a transceiver in one of the nodes 24; a break or other malfunction in the physical fiber 26 that renders a segment of the ring 22 unusable; and, total or partial failure of the hub node 30.

#### 10 Disclosure of the Invention

According to the invention, first and second optical fibers carry information modulated on an optical carrier between at least two nodes. At a first one of the nodes, information modulated on the carrier is to be recovered and transmitted. The first node includes a first receiver for recovering information from the optical carrier carried on the first optical fiber, a second receiver for recovering information modulated on the optical carrier carried on the second optical fiber, a transmitter for modulating the information on the second optical fiber, and a first splitter for splitting the optical carrier carried on the first optical fiber. The first splitter is coupled to the first optical fiber and the first receiver. The optical carrier carried on the first optical fiber is split by the first splitter. A portion of the optical carrier is coupled to the first receiver and another portion of the optical carrier continues on the first optical fiber.

Illustratively, the apparatus for receiving and transmitting the information includes a third receiver for recovering information modulated on the optical carrier carried on the second optical fiber, a fourth receiver for recovering information modulated on the optical carrier carried on the first optical fiber, a transmitter for modulating information on the first optical fiber, and a splitter for splitting the optical carrier carried on the second optical fiber. The splitter is coupled to the second optical fiber and the third receiver. A portion of the optical carrier is coupled to the third receiver and another portion of the optical carrier continues on the second optical fiber.

Illustratively, the apparatus includes a third node. The third node includes a fifth receiver for recovering information modulated on the optical carrier

-3-

and carried on the first optical fiber, a sixth receiver for recovering information modulated on the optical carrier and carried on the second optical fiber, a third transmitter for recovering information on the second optical fiber, and a third splitter for splitting the optical carrier carried on the first optical fiber. The third splitter is  
5 coupled to the first optical fiber and the fifth receiver. A portion of the optical carrier is coupled to the fifth receiver and another portion of the optical carrier continues on the first optical fiber.

Illustratively, the second node includes means for recovering the optical carrier from, and returning the optical carrier to, the first optical fiber.

10 Illustratively, the second node includes means for recovering the optical carrier from, and returning the optical carrier to, the second optical fiber.

Illustratively, the apparatus further includes a fourth node for recovering the optical carrier from, and returning said optical carrier to, the first optical fiber.

15 Illustratively, the fourth node includes means for recovering the optical carrier from, and returning the optical carrier to, the second optical fiber.

Illustratively, the first receiver and the second receiver are coupled to a selection function which selects between the optical carrier received over the first optical fiber and the optical carrier received over the second optical fiber.

20 Illustratively, the third receiver and the fourth receiver are coupled to a selection function which selects between the optical carrier received over the first optical fiber and the optical carrier received over the second optical fiber.

#### Brief Description of the Drawings

25 The invention may best be understood by referring to the following detailed description and accompanying drawings which illustrate the invention. In the drawings:

Fig. 1 illustrates a technique for overcoming the failure of a transceiver module in a fiber optic network;

30 Fig. 2 illustrates a technique for overcoming the failure of a transceiver in a fiber optic network having interconnected rings;

Fig. 3 illustrates a network constructed according to the invention;

#### Detailed Descriptions of Illustrative Embodiments

25 The failure of a transceiver module 34 can be overcome by having a second, redundant transceiver 34 in each node 24 for each wavelength accessed by that node 24. A degree of protection against fiber 26 breaks can be provided by having each node 24 transmit each of its associated wavelengths  $\lambda_J, \lambda_K, \dots \lambda_P$  in both directions around the ring 26, and having the destination node 24 select the better  
30 copy. Thus, a combined solution for these problems may be to have two transceivers 34 at each node 24 for each wavelength accessed by that node 24, one receiving and transmitting in one direction (which will sometimes be referred to herein as

-5-

eastbound) around the ring 26, and the other receiving and transmitting in the other direction (which will sometimes be referred to herein as westbound) around the ring 22.

However, the failure of a hub node 30 still threatens the reliability of the network, since the hub node 30 affects both traffic around the ring 22 and the connection of the ring 22 to other parts of the network 20. An effective solution to the problem of failure of a hub node 30 is to provide a backup for the hub node 30 in the form of a second, redundant hub 30. Providing a second hub node 30 is referred to in the art as "dual homing." This application relates to a cost-effective implementation of dual homing in the environment of DWDM networks in fiber rings 22.

A solution to the above-described problems is to have at each node 24 two transceivers 34 per associated wavelength. The two transceivers 34 at each node 24 transmit to/receive from opposite directions, westbound and eastbound. Referring to Fig. 2, dual homing is employed where two rings 22-1 and 22-2 are interconnected to provide greater fault resiliency. Two diverse paths are provided from a node 24-x on a first one, 22-1, of the rings to a node 24-y on the second ring 22-2. A hub node 30 is provided at each interconnection between the rings 22-1 and 22-2. The second ring 22-2 may be a DWDM ring like the first, or may be, for example, a SONET ring. Duplicating an entire hub node 30 may be expensive, given the high cost of DWDM transmitters. It must be remembered that a hub node 30 terminates all DWDM wavelengths in the network and therefore potentially has a large number of transmitters.

A cost-effective method for implementing dual homing in this environment achieves a 50% reduction in the required number of transmitters compared to duplicating an entire hub node 30, without sacrificing the reliability of the network 20. Referring to Fig. 3, each terminal node 32 sends two copies of its traffic, one to each of two hub nodes 30 on the network. Each hub node 30 effects the cross-connect function on all terminal node 32 traffic. Traffic intended for other terminal nodes 32 on the same fiber optic ring 22 is sent on the corresponding downlinks, along with traffic originating in the hub node 30's tributaries. Traffic intended for the hub node 30's local tributary ports is forwarded to those ports. Each

terminal node 32 receives two copies of the downlink, one from each hub node 30, and selects the better received one using a conventional selection method.

In a dual-interconnection configuration, a hub node 30 is located at each interconnection point. Each terminal node 32 sends two copies of its traffic, one to each hub node 30. Each hub node 30 effects the cross-connect function on all terminal node 32 traffic. Traffic intended for other terminal nodes 32 within the same fiber optic ring 22 is sent on the corresponding downlinks. Each hub node, for example, hub node 30-1-1, on the transmitting ring, for example, ring 22-1, sends its copy of the inter-ring traffic to its matching interconnection hub node, for example, hub node 30-2-1, on the receiving ring, for example, ring 22-2. In the receiving ring 22-2, the destination terminal node 32 receives the traffic from both hub nodes 30 on its ring 22-2 and selects the better-received signal using a conventional selection method. This is illustrated in Fig. 4. This logical topology, which may be called a “dual-homed star” topology, is illustrated in Fig. 5.

In order to enhance the reliability of the illustrated system, it is desirable to have each hub node 30 receive both uplinks from each terminal node 32. In other words, each hub node 30 drops the uplink it receives, but also continues that uplink to the other hub node 30. This is illustrated in Fig. 6. Each hub node 30 selects the best received copy of each uplink using the selection method and uses the best received copy. When this topology is used, each hub node 30 receives at least one copy of each uplink even when a fiber cut or a failed transmitter disrupts the reception of the other uplink at that hub 30. Using this strategy, which is sometimes called “drop and continue” functionality, also enhances the robustness of a network including interconnected rings 22-1, 22-2. For example, such a network can withstand two simultaneous fiber cuts, one in each ring 22. Drop and continue functionality is used in SONET UPSR rings for these reasons. In SONET networks, the function is implemented electronically. The optical signal of the uplink is converted to an electrical signal and duplicated, one of the duplicate electrical signals becoming a “drop” signal and the other becoming a “continue” signal. The “continue” signal is then retransmitted using another transmitter 38 to the other hub node 30. A similar implementation could be used for hub nodes 30 in DWDM rings 22.

-7-

Fig. 7 illustrates functions of a hub node 30 for each DWDM wavelength. As may be appreciated, this approach requires two receivers 36 and two transmitters 38 per wavelength. The high cost of DWDM transmitters 38 can make such a strategy rather expensive. In order to eliminate one of the two transmitters 38 the illustrated approach employs optical drop and continue functionality. This is illustrated in Fig. 8. An optical coupler/splitter 40 is used to split the power of the arriving uplink. Some of the power is then directed to the local receiver 36 and the rest is continued to the other hub node 30. The need for a second transmitter 38 is thus overcome. This results in reducing by 50% the number of required transmitters 38 for the two hub nodes 30, while still meeting all the reliability requirements of the dual homing strategy. For example, the network is protected against the failure of a transceiver 34. Each terminal node 32 has two transceivers 34, and is able to send and receive even if one of them fails. Each hub node 30 has two receivers 36 per wavelength, and so is not affected by the loss of one of them.

The loss of a transmitter 38 in one of the hub nodes 30 will not disrupt traffic either, since the transmitter 38 in the other hub node 30 can still transmit the downlink to the destination terminal node 32. The network is protected against fiber cuts. Each terminal node 32 receives two copies of its downlink on completely diverse paths. Likewise each hub node 30 receives two copies of each uplink on completely diverse paths. Thus, no single fiber cut can disrupt the interconnection of the two rings 22. The network is also protected against the loss of a hub node 30. The functions of each hub node 30 are substantially completely duplicated by the other hub nodes 30. Thus the network remains functional even when one of the hub nodes 30 fails partially or completely.

Fig. 9 illustrates a high-level functional diagram of terminal nodes 32. A processing subsystem 41 provides protocol processing appropriate to a particular application. Examples include SONET/SDH multiplexers and ATM multiplexers. The processing subsystem 41 provides electrical signals to an optical subsystem 42, to be transmitted as the uplink on (a) DWDM channel(s)  $\lambda_J$  ( $\lambda_K, \dots \lambda_P$ ) associated with that terminal node 32, and receives electrical signals derived from the associated downlink DWDM channel(s)  $\lambda_J$  ( $\lambda_K, \dots \lambda_P$ ). The processing subsystem 41 typically also has external ports of different types in order to connect external devices

-8-

which use the transport services of network 20. The optical subsystem 42 implements the optical add/drop function for the DWDM channel(s)  $\lambda_J$  ( $\lambda_K, \dots \lambda_P$ ). It also incorporates the required transceivers 34. A control subsystem 44 manages, configures and monitors the operation of the processing and optical subsystems 41 and 42, respectively.

Fig. 10 illustrates a high-level functional diagram of a hub node 30. A processing subsystem 46 provides protocol-related processing functions such as the cross-connect/switching function and protocol processing for wavelengths  $\lambda_1, \lambda_2, \dots \lambda_N$  generated by hub node 30. In case of a SONET/SDH application, the processing subsystem 46 provides the functionality of a SONET/SDH cross-connect, as well as all SONET/SDH-related protocol processing. In the case of an ATM application, the processing subsystem 46 provides the functionality of an ATM VPX and the associated protocol processing. The processing subsystem 46 provides to an optical subsystem 48 an electrical channel for each DWDM channel  $\lambda_1, \lambda_2, \dots \lambda_N$  generated by node 30. The processing subsystem 46 receives the electrical signals derived from all incoming DWDM optical uplink signal  $\lambda_1, \lambda_2, \dots \lambda_N$ . The processing subsystem 46 typically also has external ports of different types in order to connect external devices which use the transport services of the network. The optical subsystem 48 has the capability to generate/terminate all the DWDM channels  $\lambda_1, \lambda_2, \dots \lambda_N$  being used in the network 20. The optical subsystem 48 incorporates multiplexing/demultiplexing functionality for the DWDM channels  $\lambda_1, \lambda_2, \dots \lambda_N$ , as well as suitable transmitters and receivers. A control subsystem 54 manages, configures and monitors the operation of the processing and optical subsystems 46, 48, respectively.

Fig. 11 illustrates certain details of an implementation of a dual-homed DWDM ring 22. An optical add/drop multiplexer, or OADM, 60-1, 60-2 is able to drop a specific wavelength  $\lambda_D$ ,  $1 \leq D \leq N$ , from a DWDM combined signal on the fiber and route the dropped wavelength  $\lambda_D$  to a DWDM transceiver module 34-1, 34-2, respectively. The optical signal having the same wavelength  $\lambda_D$  generated by the DWDM transceiver 34-1, 34-2, respectively, is inserted by the OADM 60-1, 60-2, respectively, into the aggregate DWDM signal  $\lambda_1, \lambda_2, \dots \lambda_N$  on the fiber. Each OADM 60 is assigned to a specific DWDM wavelength  $\lambda_D$ , and passes all other wavelengths unaffected. OADMs 60 are commercially available from several

-9-

vendors. DWDM transceiver 34 is a set including a receiver 36 and a transmitter 38, both for a specific wavelength  $\lambda_D$ . The transmitter 38 transforms an electrical signal generated, for example, by the processing subsystem 41, into an optical signal at a wavelength  $\lambda_D$ . The receiver 36 transforms an optical signal at wavelength  $\lambda_D$  to an electrical signal and provides it to the processing subsystem 41. Such transmitters 38 and receivers 36 are commercially available from several vendors.

Fig. 12 illustrates an implementation of an optical subsystem 48 of the hub node 30 in a dual-hub configuration. A DWDM multiplexer 70-1, 70-2 multiplexes several optical signals, each having a different wavelength  $\lambda_1, \lambda_2, \dots \lambda_N$ , into a single fiber output. DWDM multiplexers 70 are commercially available from several vendors. A DWDM demultiplexer 72-1, 72-2 separates a DWDM signal carried on a fiber 26 and containing several optical channels, each of a different wavelength  $\lambda_1, \lambda_2, \dots \lambda_N$ , into separate channel outputs  $\lambda_1, \lambda_2, \dots \lambda_N$  on separate optical fibers 74. DWDM demultiplexers 72 are also commercially available from several vendors. An optical channel module, or OCM,  $76-\lambda_L$ ,  $1 \leq L \leq N$ , is provided for each wavelength  $\lambda_1, \lambda_2, \dots \lambda_N$ , respectively. Each OCM  $76-\lambda_L$  incorporates one DWDM transmitter  $38-\lambda_L$  and two receivers  $36-\lambda_L-1$  and  $36-\lambda_L-2$  for the corresponding wavelength  $\lambda_L$ . Such receivers  $36-\lambda_L-1$  and  $36-\lambda_L-2$  and transmitters  $38-\lambda_L$  are commercially available from several vendors. There are two configurations of OCMs  $76-\lambda_L$ , the eastern configuration  $76-\lambda_L-E$ , and the western configuration  $76-\lambda_L-W$ . Fig. 13 illustrates the western configuration OCM  $76-\lambda_L-W$ . The incoming signals from two DWDM demultiplexers 72-1, 72-2 are coupled to the receivers  $36-\lambda_L-1$  and  $36-\lambda_L-2$ . The resulting electrical signals are evaluated 84 for quality using, for example, the SONET overhead provisions, and the better quality one is provided to the processing subsystem 46. The western incoming signal is duplicated using a splitter 40, for example, an optical coupler, and transmitted to the eastern output. Again, this is an optical drop and continue operation. Such optical couplers 40 are commercially available from several vendors. The electrical signal provided by the processing subsystem 46 is transmitted on the western output. The description of the eastern configuration OCM  $76-\lambda_L-E$  is identical to the western configuration OCM  $76-\lambda_L-W$ , except that east and west are reversed. That is, the eastern incoming signal

-10-

is continued through a splitter 40 to the western output, and the signal generated by the transmitter 78- $\lambda$ L is sent to the eastern output.

Different OCMs 76 within the same hub node 30 can be configured differently. The choice of a configuration for a specific OCM 76 depends on the relative location of the associated terminal node 32 with respect to the two hub nodes 30. This is illustrated in Fig. 14. Terminal node 32-1 is located to the east of hub node 30-1 and to the west of hub node 30-2. Therefore the OCM 76- $\lambda$ L-E in hub node 30-1 associated with terminal node 32-1 will have an eastern configuration, while the OCM 76- $\lambda$ L-W in hub node 30-2 associated with terminal node 32-1 will have a western configuration. The result is that the copy of the signal transmitted by terminal node 32-1 in the direction of hub node 30-1 will be received by hub node 30-1 and continued to hub node 30-2 around the ring 22 in one direction. The copy of the signal transmitted by terminal node 32-1 in the direction of hub node 30-2 will be received by hub node 30-2 and continued to hub node 30-1 around the ring 22 in the other direction. Each hub node 30 will receive two copies of the signal generated by terminal node 32-1, one from each direction of the ring 22. Terminal node 32-2 is located to the west of hub node 30-1 and to the east of hub node 30-2. Therefore the OCM 76- $\lambda$ L-W associated with terminal node 32-2 in hub node 30-1 will have a western configuration. The OCM 76- $\lambda$ L-E associated with terminal node 32-2 in hub node 30-2 will have an eastern configuration.

CLAIMS:

1. In combination, first and second optical fibers for carrying information modulated on an optical carrier, at least two nodes at a first one of which  
5 information modulated on the carrier is to be recovered and transmitted, the first node including apparatus for receiving and transmitting the information, the apparatus for receiving and transmitting the information including a first receiver for recovering the information from the optical carrier carried on the first optical fiber, a second receiver for recovering information modulated on the optical carrier carried on the second  
10 optical fiber, a transmitter for modulating information on the second optical fiber, and a first splitter for splitting the optical carrier carried on the first optical fiber, the first splitter coupled to the first optical fiber and the first receiver.
2. The apparatus of claim 1 further including a third node, the third node including apparatus for receiving and transmitting the information, the  
15 apparatus for receiving and transmitting the information including a third receiver for recovering information from the optical carrier carried on the first optical fiber, a fourth receiver for recovering information from the optical carrier carried on the second optical fiber, a second transmitter for modulating information on the second optical fiber, and a second splitter for splitting the optical carrier carried on the first  
20 optical fiber, the second splitter coupled to the first optical fiber and the third receiver.
3. The apparatus of claim 1 wherein the second node includes means for recovering said optical carrier from, and returning said optical carrier to, the first optical fiber.
4. The apparatus of claim 2 wherein the second node includes  
25 means for recovering said optical carrier from, and returning said optical carrier to, the first optical fiber.
5. The apparatus of claim 3 wherein the second node includes means for recovering said optical carrier from, and returning said optical carrier to, the second optical fiber.
- 30 6. The apparatus of claim 4 wherein the second node includes means for recovering said optical carrier from, and returning said optical carrier to, the second optical fiber.

-12-

7. The apparatus of claim 1 wherein the apparatus for receiving and transmitting the information includes a third receiver for recovering information from the optical carrier carried on the second optical fiber, a fourth receiver for recovering information from the optical carrier carried on the first optical fiber, a  
5 transmitter for modulating information on the first optical fiber, and a splitter for splitting the optical carrier carried on the second optical fiber, the splitter coupled to the second optical fiber and the third receiver.

8. The apparatus of claim 2 wherein one of the first and third nodes includes a fifth receiver for recovering information from the optical carrier  
10 carried on the second optical fiber, a sixth receiver for recovering information from the optical carrier carried on the first optical fiber, a third transmitter for modulating information on the first optical fiber, a third splitter for splitting the optical carrier carried on the second optical fiber, the third splitter coupled to the second optical fiber and the fifth receiver.

9. The apparatus of claim 3 wherein the apparatus for receiving and transmitting the information includes a third receiver for recovering information modulated on the optical carrier and carried on the second optical fiber, a fourth  
15 receiver for recovering information modulated on the optical carrier and carried on the first optical fiber, a transmitter for modulating information on the first optical fiber, and a splitter for splitting the optical carrier carried on the second optical fiber, the  
20 splitter coupled to the second optical fiber and the third receiver.

10. The apparatus of claim 4 wherein one of the first and third nodes includes a fifth receiver for recovering information modulated on the optical carrier and carried on the second optical fiber, a sixth receiver for recovering  
25 information modulated on the optical carrier and carried on the first optical fiber, a third transmitter for modulating information on the first optical fiber, and a third splitter for splitting the optical carrier carried on the second optical fiber, the third  
splitter coupled to the second optical fiber and the fifth receiver.

11. The apparatus of claim 5 wherein the apparatus for receiving and transmitting the information includes a third receiver for recovering the  
30 information modulated on the optical carrier and carried on the second optical fiber, a fourth receiver for recovering information modulated on the optical carrier and carried

-13-

on the first optical fiber, a transmitter for transmitting information on the first optical fiber, and a splitter for splitting the optical carrier carried on the second optical fiber, the splitter coupled to the second optical fiber and the third receiver.

12. The apparatus of claim 6 wherein one of the first and third  
5 nodes includes a fifth receiver for recovering information modulated on the optical carrier and carried on the second optical fiber, a sixth receiver for recovering information modulated on the optical carrier and carried on the first optical fiber, a third transmitter for transmitting information on the first optical fiber, and a third  
10 splitter for splitting the optical carrier carried on the second optical fiber, the third splitter coupled to the second optical fiber and the fifth receiver.

13. The apparatus of claim 1 wherein the first receiver and the second receiver are coupled to a selection function which selects between the optical carrier from the first optical fiber and the optical carrier from the second optical fiber.

14. The apparatus of claim 2 wherein the first receiver and the  
15 second receiver are coupled to a selection function which selects between the optical carrier from the first optical fiber and the optical carrier from the second optical fiber.

15. The apparatus of claim 14 wherein the third receiver and the fourth receiver are coupled to a selection function which selects between the optical carrier from the first optical fiber and the optical carrier from the second optical fiber.

20 16. The apparatus of claim 3 wherein the first receiver and the second receiver are coupled to a selection function which selects between the optical carrier from the first optical fiber and the optical carrier from the second optical fiber.

17. The apparatus of claim 4 wherein the first receiver and the  
25 second receiver are coupled to a selection function which selects between the optical carrier from the first optical fiber and the optical carrier from the second optical fiber.

18. The apparatus of claim 17 wherein the third receiver and the fourth receiver are coupled to a selection function which selects between the optical carrier from the first optical fiber and the optical carrier from the second optical fiber.

19. The apparatus of claim 5 wherein the first receiver and the  
30 second receiver are coupled to a selection function which selects between the optical carrier from the first optical fiber and the optical carrier from the second optical fiber.

-14-

20. The apparatus of claim 6 wherein the third receiver and the fourth receiver are coupled to a selection function which selects between the optical carrier from the first optical fiber and the optical carrier from the second optical fiber.

21. The apparatus of claim 20 wherein the first receiver and the  
5 second receiver are coupled to a selection function which selects between the optical carrier from the first optical fiber and the optical carrier from the second optical fiber.

22. The apparatus of claim 1, 3, 5, 7, 9 or 11 wherein the second node includes means for recovering said optical carrier from, and returning said optical carrier to, the second optical fiber.

10 23. The apparatus of claim 22 further including a third node for recovering said optical carrier from, and returning said optical carrier to, the first optical fiber.

24. The apparatus of claim 2, 4, 6, 8, 10 or 12 wherein the second node includes means for recovering said optical carrier from, and returning said  
15 optical carrier to, the second optical fiber.

25. The apparatus of claim 24 further including a third node for recovering said optical carrier from, and returning said optical carrier to, the first optical fiber.

26. The apparatus of claim 1, 3, 5, 7, 9 or 11 further including a  
20 third node for recovering said optical carrier from, and returning said optical carrier to, the first optical fiber.

27. The apparatus of claim 2, 4, 6, 8, 10 or 12 further including a fourth node for recovering said optical carrier from, and returning said optical carrier to, the first optical fiber.

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US00/00105

**A. CLASSIFICATION OF SUBJECT MATTER**

IPC(7) :H04B 10/00, 10/04, 10/06, 10/12, 10/28

US CL :359/118, 119, 152, 154, 164

According to International Patent Classification (IPC) or to both national classification and IPC

**B. FIELDS SEARCHED**

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 359/118, 119, 152, 154, 164

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

IEEE DATABASE

search term: ring network, node, transceiver

**C. DOCUMENTS CONSIDERED TO BE RELEVANT**

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	US 5,647,035 A (CADEDDU et al) 08 JULY 1997, FIGURES 1-6	1-27
Y	US 4,482,980 A (KOROWITZ et al) 13 NOVEMBER 1984, FIGURES 1, 2, AND 4	1-27
Y	US 5,406,401 A (KREMER) 11 APRIL 1995, FIGURES 1 AND 2	1-27
Y	US 4,704,713 A (HALLER et al) 03 NOVEMBER 1987, FIGURES 2A, 3	1-27
Y	US 4,837,856 A (GLISTA, JR) 06 JUNE 1989, FIGURES 2, 5	1-27

☐ Further documents are listed in the continuation of Box C. ☐ See patent family annex.

* Special categories of cited documents:	*T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
*A* document defining the general state of the art which is not considered to be of particular relevance	*X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
*B* earlier document published on or after the international filing date	*Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
*L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	*Z* document member of the same patent family
*O* document referring to an oral disclosure, use, exhibition or other means	
*P* document published prior to the international filing date but later than the priority date claimed	

Date of the actual completion of the international search

16 MAY 2000

Date of mailing of the international search report

28 AUG 2000
